Nested PCR

*Spinodiplotriaena*

**1.**

*Spinodiplotriaena* is a genus of viruses in the family *Orthoreoviridae* subfamily *Ortheovirinae*. Viruses in this genus are transmitted to humans by *Aedes aegypti* mosquitoes and cause fever, jaundice, and other symptoms. The virus is named after the Spinodiplotriaena virus, which was first isolated in the 1970s.

**2.**

*Spinodiplotriaena* has a double-stranded RNA genome with nine segments. The virus is classified in the order *Orthomyxovirales*, which includes other important viruses such as the influenza virus and the Newcastle disease virus.

**3.**

The virus is known to be associated with febrile illness in humans, but its exact role in disease is not fully understood. Further research is needed to better understand the virus and its impact on human health.
